EXAMINER	
YANG, NELSON C	

ART UNIT	PAPER NUMBER
1641	

DATE MAILED: 05/18/2005

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary	Application No.	Applicant(s)	
	09/527,767	KREISS ET AL.	
	Examiner	Art Unit	
	Nelson Yang	1641	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1)☒ Responsive to communication(s) filed on *24 January 2005*.

2a)☐ This action is **FINAL**. 2b)☒ This action is non-final.

3)☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4)☒ Claim(s) *27-43* is/are pending in the application.

4a) Of the above claim(s) _____ is/are withdrawn from consideration.

5)☐ Claim(s) _____ is/are allowed.

6)☒ Claim(s) *27-43* is/are rejected.

7)☐ Claim(s) _____ is/are objected to.

8)☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9)☐ The specification is objected to by the Examiner.

10)☒ The drawing(s) filed on 8/17/00 is/are: a)☒ accepted or b)☐ objected to by the Examiner.

Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11)☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

12)☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

a)☐ All b)☐ Some * c)☐ None of:

1.☐ Certified copies of the priority documents have been received.

2.☐ Certified copies of the priority documents have been received in Application No. _____.

3.☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

1) ☒ Notice of References Cited (PTO-892)
2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
3) ☒ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08) Paper No(s)/Mail Date 2-10-05
4) ☐ Interview Summary (PTO-413) Paper No(s)/Mail Date. _____.
5) ☐ Notice of Informal Patent Application (PTO-152)
6) ☐ Other: _____.

RD

DETAILED ACTION

Rejections Withdrawn

1. Applicant's arguments, see p.5-6, filed January 24, 2005, with respect to the rejection(s)of claim(s) claims 27-43 under Simpson et al [US 6,117,643] have been fully considered and are persuasive. Therefore, the rejection has been withdrawn. However, upon further consideration, a new ground(s) of rejection is made in view of Thastrup et al [US 6,518,021].

2. Claims 27-43 are pending.

Claim Rejections - 35 USC § 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

> (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

4. Claims 27-29, 31-39, 41-43 are rejected under 35 U.S.C. 103(a) as being unpatentable over Simpson et al [US 6,117,643] in view of Thastrup et al [US 6,518,021].

Simpson et al teach a biosensor comprising bioreporters enclosed in polymer matrix (column 7, lines 65-67). Simpson et al specifically teach encapsulated cells that can be formed into sheets or thickness or diameter desired, where cells may be added to molten agar or agarose, where gelation occurs as the agar or agarose cools to room temperature (column 68, lines 33-51). Simpson et al further teach that the polymer matrix provides the cells with a greater degree of protection (column 6, lines 45-55), and also teach that encapsulation allows for long term

application of the biosensor (column 68, lines 5-20). Simpson et al fail to teach a means for detecting the spatial distribution of signals produced when the substance is in contact with at least one spatially-discrete area of the sheet of the polymer matrix

Thastrup et al, however, teach the monitoring and recording of quantitative information correlating the spatial distribution or change in the spatial distribution of cell luminescence (column 4, lines 15-30), and further teach that this makes it possible to set up meaningful relationships between the influences of a chemical substance or mixture of chemical substances on cellular systems and the redistribution response in both a fast and reproducible manner (column 3, lines 40-60).

Therefore, it would have been obvious in the device of Simpson et al to have a means for detecting the spatial distribution of signals produced when the substance is in contact with at least one spatially-discrete area of the sheet of the polymer matrix, as suggested by Thastrup et al, in order to make it possible to set up meaningful relationships between the influence of a chemical substance or mixture of chemical substances on cellular systems and the redistribution response in both a fast and reproducible manner.

5. With respect to claim 28, Simpson et al further teach a substrate that contains the matrix and the photodetector as well as additional circuitry that processes and transmits the signal.

6. With respect to claim 29, Simpson et al teach that the matrix may comprise agar or agarose (column 68, lines 33-51).

7. With respect to claim 31, Simpson et al teach that catalytic antibodies with sufficiently fast antigen dissociation rates to allow reversible measurements in real time may also be used (column 21, lines 5-26).

8. With respect to claim 32, Simpson et al teach the use of different bioreporters (figs 9A-D, column 5, lines 28-30).

9. With respect to claim 33, Simpson et al teach the cells may have a second signal transducer to function as an internal control signal, which may serve as a dynamic baseline with which to compare the target signal (column 22, lines 23-32).

10. With respect to claims 34-35, Simpson et al teach the incubation of encapsulated HK44 with groundwater and 0.1xYEPG medium, and the use of simple and complex inducer solutions (column 65, lines 1-28).

11. With respect to claim 36, Simpson et al teach the use of fluorescent and enzymatic labels (column 31, lines 20-35).

12. With respect to claim 37, Simpson et al teach that layers of encapsulation can also be produced (column 69, lines 35-40).

13. With respect to claims 38-39, Simpson et al teach that cells may be added to molten agar or agarose of 1% to 5% (column 68, lines 48-50). Therefore, in 50 mL of the agar or agarose, there would be 2 to 10 mL of cells.

14. With respect to claim 40, while Simpson et al teach biosensors comprising bioreporters enclosed in polymer matrix as discussed above, Simpson et al fail to specifically teach that the biosensor has an optical density of 0.6 to 1.4 at 660 nm. However, it has been held that where the general conditions of a claim are disclosed in the prior art, discovering the optimum or workable ranges involves only routine skill in the art. *In re Aller*, 105 USPQ 233.

15. Therefore it would have been obvious through normal optimization techniques to a person of ordinary skill in the art to obtain a biosensor with an optical density of 0.6 to 1.4 at 660 nm.

16. With respect to claims 41-43, Simpson et al teach that the sheets can be 0.1-2 mm (column 68, lines 39-41).

17. Claim 30 is rejected under 35 U.S.C. 103(a) as being unpatentable over Simpson et al [US 6,117,643] in view of Thastrup et al [US 6,518,021], and further in view of Ribi [US 5,156,810].

Simpson et al teach biosensors comprising bioreporters enclosed in polymer matrix as discussed above. Simpson et al do not specifically teach polyacrylates as the polymer.

Ribi, however, teaches that polyacrylate is inert and has good electrical insulating properties, is smooth at the molecular level, and has good adhering properties (column 3, lines 27-35).

Therefore it would have been obvious to use polyacrylate as the polymer in the biosensors of Simpson et al, as suggested by Ribi, since polyacrylate is inert and has good electrical insulating properties, is smooth at the molecular level, and has good adhering properties, and therefore would not interfere with the optical detection of the presence of substances.

Conclusion

18. No claims are allowed.

19. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Nelson Yang whose telephone number is (571) 272-0826. The examiner can normally be reached on 8:30-5:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Long V. Le can be reached on (571)272-0823. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

20. Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
